

Chapter 5: Eigenvalues, Eigenvectors, and Invariant Subspaces

Exercises 5A - Invariant Subspaces

Problem 1

Suppose $T \in \mathcal{L}(V)$ and U is a subspace of V .

- (a) Prove that if $U \subseteq \text{null } T$, then U is invariant under T .
- (b) Prove that if $\text{range } T \subseteq U$, then U is invariant under T .

Proof. (a) Consider $u \in U$. $Tu = 0$. $0 \in U$. So $T(u) \in U$. Hence, U is invariant under T .

(b) Consider $u \in U$. $T(u) \in \text{range } T \subseteq U$. Hence $T(u) \in U$. Hence U is invariant under T . \square

Problem 2

Suppose $T \in \mathcal{L}(V)$ and V_1, \dots, V_m are invariant subspaces of T . Prove $V_1 + \dots + V_m$ is invariant under T .

Proof. Consider an arbitrary element $v \in V_1 + \dots + V_m$. It can be expressed as $v = v_1 + \dots + v_m$, where $v_i \in V_i$. $T(v) = T(v_1 + \dots + v_m) = T(v_1) + \dots + T(v_m)$. Since V_i is invariant under T , $T(v_i) \in V_i$. Hence $T(v) \in V_1 + \dots + V_m$ if $v \in V_1 + \dots + V_m$. \square

Problem 3

Suppose $T \in \mathcal{L}(V)$. Prove that the intersection of every collection of subspaces of V invariant under T is invariant under T .

Proof. Consider an arbitrary element v in the intersection of the invariant subspaces $((V_1, V_2, \dots))$. Since each of the subspaces are invariant, $T(v) \in V_i$. Hence $T(v) \in V_1 \cap V_2 \cap \dots$. Hence intersection of invariant subspaces under some linear transformation is invariant. \square
